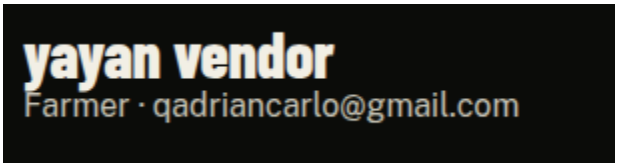
I am planning to have a things to add and things to improve

Things to add:

- Profile page: I want to add a add a profile / avatar picture
  And i want to fix this: make sure to have at least space dont make them so close



- Profile page: Instead of “send Sakada a message” make it “Contact Support” and when a user clicks it: a modal will pop up or a new contact support page will open.
- Profile page: for the “How it works” instead of after the user clicks it then going to the web page, make it when the user clicks the “How it works” it will show a like it will ask the user to see it on the webpage, then it will provide a link. Because I want our app to be like an app only, not going to the web app.
- Profile page: add also an “Edit profile” wherein the user can change their profile / avatar picture, name, and change password.
- Profile page: Address, like save address, that can use when booking.
- Booking page: after the user confirming a booking, a booking code will show, I want it to have a copy booking code, so that the user can paste it on the “Track you shipment”

Things to improve:

- Logout: when the user clicks the logout, make sure to have a danger / warning confirming if the user wants to logout.
- Booking page: on the shipment details, i want to combine the what are you shipping and total weight. And i want also an auto predict for the “What are you shipping” like i want to have a list of vegetable produce, and when the user types a vegetable that close to the letter will show, and after the user clicks it, a new row will show again so that if the user wants more vegetables to ships, it can. After that, besides that a “kg” will have a scrollable choosing, instead of typing, i want to have a scrollable when choosing a number.
